## Abstract

Cancer that originates in the colon or rectum is colorectal cancer. Stadium 0, which is extremely early cancer, to stage 4, colorectal cancer is stage 4 of this form of cancer. Colorectal cancer is a malignancy. It therefore spreads to local or remote such as other organs or lymph nodes. Although cancer spreads to any region of the body, according to the Cancer / Trusted Source, colorectal cancer is the most common disease to liver, lung or peritoneum. Approximately 21% Trusted sources of colorectal cancer newly diagnosed have remote illness when they are diagnosed. In later stages once the disease has grown or spread, colorectal cancer will produce symptoms more probable.

Change in bowel habits such nausea, or thin stools, which longer than few days, may make a stool seem reddish blood maroon, or black blood rectal, as if the colon did not empty bowel to cramp or discomfort.

You may have another a clinical trial, if you have tried some colon cancer therapy and they have not worked or ceased in clinical trials, researchers are exploring novel approaches of stage IV colon cancer. These studies evaluate novel therapies for the safety and working they provide a method for to sample a new drug which is not accessible to everybody. If one of the studies might be helpful for you, your doctor can inform you.
